Important instruction:

Steps:

- Write a program that contains two structures respectively for *Author* and *Book. Author* has name and, address fields. *Book* has id, name, and its author fields.
- Take a **global** array of *Book* called *bookArr.* Write a function *storeBook()* that takes book id, name, author name, and address as argument and store the Book information in the *bookArr.*
- Finally write a function *printBookInfo()* that takes book id as argument, and print the respective book details (book id, name, author name, and address) from *bookArr.*
